

# AEROSPACE ACCESSORIES

To maintain safe operation, aircraft often need specialized repair services for the various accessories they have. VE Aerospace is an FAA and EASA Approved Part 145 Repair Station that offers reliable services and outstanding quality to each aircraft component supported. No matter what your needs may be, our quick turn-around times ensure that your aircraft is back in commission with a minimal delay so you can focus on what matters most. No matter what accessories you may need or what repairs may be necessary, the team at VE Aerospace is here to help.

## What's Possible?

With over 80 years of collective experience in the aviation industry, the team at VE Aerospace has the experience and knowledge needed to quickly diagnose problems that are occurring with accessories and find an adequate solution to ensure our customers experience minimal delays. Some of the aerospace accessories that we provide repair services for include:

### Actuation Systems

As a vital part of any aircraft, actuation systems assist in movement and flight navigation to ensure safer and more efficient travel. Because there are many different components within an actuation system, it is important to ensure your repairs are done by a qualified provider. VE Aerospace has the certifications and knowledge needed to pinpoint actuation problems and address them with approved repair methods.

### Aircraft Switches and Sensors

It is no secret that each aircraft is equipped with countless switches and sensors that each control different functions; however, when these switches or sensors fail to work properly, it can signal that a more serious problem is occurring. As a repair provider for aircraft switches, VE Aerospace can diagnose the cause of switch failure and restore functionality.

### Electrical Harness Systems

All aircraft are equipped with electrical wiring harnesses to connect subsystems and other components throughout the aircraft. While the type of harnessing can vary widely depending on the user environment or OEM requirements, repairing electrical harness systems is critical for ensuring a safe flight each time the aircraft leaves the runway. VE Aerospace can provide thorough harness inspection, maintenance, and repair for all types of aircraft harness systems.

### Oxygen Systems and Hoses

As one of the most prominent safety features found in modern aircraft, oxygen systems and hoses serve a critical role whenever they may be needed in the event of a fire, smoke, fume release, or loss of pressurization. VE Aerospace is capable of inspecting oxygen systems and hoses for potential problems and repairing them as needed to provide appropriate support.
